

# Watertight International Non-Return Valve

*The simple way to stop...*

## Backflow Flooding

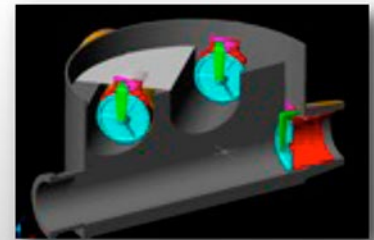

Backflow flooding can happen to any property, even if the area is not threatened by floods. Sewers become blocked and waste water is forced up into your property.

## Pest Infestation

Outflow pipes leading from domestic or commercial properties into drains, manholes or sewers offer a way in for rats and other pests, bringing with them the risk of damage and disease.

Watertight International's non-return valve is an affordable way to banish these threats forever. It is simply pushed into the open end of the drainage pipe in your manhole/inspection chamber, saving you hundreds of pounds against the cost of installing a conventional non-return valve.

# Watertight International Non-Return Valve

## What does it do?

### Prevents Backflow Flooding

If waste water from the drains or toilet is forced back up the pipes into your house - that's backflow flooding. Our valve stops that.

### Defence against Pests

It isn't only water trying to get in. Rats and other pests are attracted by the food and warmth inside. Our valve keeps them out.

### Excludes Noxious Fumes

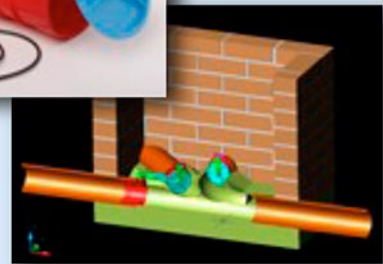

In areas where unwanted smells can seep back up your pipes, the unique seal on our valve makes sure they stay down below.

## How does it work?

The valve pushes directly into the end of the outlet pipe where it opens into the inspection chamber/manhole. Quick and easy to install, it is highly affordable.

The non-return valve works exactly like conventional valves, allowing water to pass out through it but shutting swiftly and firmly when the flow reverses, thanks to our unique wraparound seal.

If you have access to the inspection chamber/manhole you can fit the valve yourself - no special knowledge or tools required. Otherwise a local tradesman will be able to fit it in half an hour - saving you hundreds of pounds against the cost of installing a conventional non-return valve.

It is estimated that backflow accounts for **50%** of all flood damage in the UK

## Which pipes?

The internal non-return valve comes in a standard 4"/110mm size to fit plastic pipes. The 4"/110mm ceramic pipe version available April 2011.

## Patents

Int'l Patent Pending: app no PCT/EP2010/062812  
Water Research Centre approved: PT/314/0111
